1

The Divide-and-Conquer Process in Merge Sort

Suppose we want to sort a typical subarray $A[p..r]$.

DIVIDE: Split $A[p..r]$ at midpoint q into two subarrays $A[p..q]$ and $A[q + 1..r]$ of equal or almost equal length.

CONQUER: Recursively sort $A[p..q]$ and $A[q + 1..r]$.

COMBINE: Merge the two sorted subarrays $A[p..q]$ and $A[q + 1..r]$ to obtain a longer sorted subarray $A[p..r]$.

The DIVIDE step is cheap — takes only $\Theta(1)$ time.
But the COMBINE step is costly — takes $\Theta(n)$ time, where n is the length of $A[p..r]$.

2

The Divide-and-Conquer Process in Quicksort

Suppose we want to sort a typical subarray $A[p..r]$.

DIVIDE: Partition $A[p..r]$ into two (possibly empty) subarrays $A[p..q - 1]$ and $A[q + 1..r]$ and find index q such that

- each element of $A[p..q - 1]$ is $\leq A[q]$, and
- each element of $A[q + 1..r]$ is $\geq A[q]$.

CONQUER: Recursively sort $A[p..q - 1]$ and $A[q + 1..r]$.

COMBINE: Since $A[q]$ is “equal or larger” and “equal or smaller” than everything to its left and right, respectively, and both left and right parts are sorted, subarray $A[p..r]$ is also sorted.

The COMBINE step is cheap — takes only $\Theta(1)$ time.
But the DIVIDE step is costly — takes $\Theta(n)$ time, where n is the length of $A[p..r]$.

3

Quicksort

Input: A subarray $A[p : r]$ of $r - p + 1$ numbers, where $p \leq r$.

Output: Elements of $A[p : r]$ rearranged in non-decreasing order of value.

```
QUICKSORT ( A, p, r )
1.  if p < r then
2.    // partition A[p..r] into A[p..q - 1] and A[q + 1..r] such that everything in
        A[p..q - 1] is  $\leq A[q]$  and everything in A[q + 1..r] is  $\geq A[q]$ 
3.    q = PARTITION ( A, p, r )
4.    // recursively sort the left part
5.    QUICKSORT ( A, p, q - 1 )
6.    // recursively sort the right part
7.    QUICKSORT ( A, q + 1, r )
```

4

(Prerequisites Review 3) Deterministic Quicksort and Average Case Analysis

Partition

Input: A subarray $A[p : r]$ of $r - p + 1$ numbers, where $p \leq r$.
Output: Elements of $A[p : r]$ are rearranged such that for some $q \in [p, r]$ everything in $A[p : q - 1]$ is $\leq A[q]$ and everything in $A[q + 1 : r]$ is $\geq A[q]$. Index q is returned.

```
PARTITION ( A, p, r )
1.  x = A[r]
2.  i = p - 1
3.  for j = p to r - 1
4.      if A[j] ≤ x
5.          i = i + 1
6.          exchange A[i] with A[j]
7.  exchange A[i + 1] with A[r]
8.  return i + 1
```

5

Correctness of Partition

Input: A subarray $A[p : r]$ of $r - p + 1$ numbers, where $p \leq r$.
Output: Elements of $A[p : r]$ are rearranged such that for some $q \in [p, r]$ everything in $A[p : q - 1]$ is $\leq A[q]$ and everything in $A[q + 1 : r]$ is $\geq A[q]$. Index q is returned.

```
PARTITION ( A, p, r )
1.  x = A[r]
2.  i = p - 1
3.  for j = p to r - 1
4.      if A[j] ≤ x
5.          i = i + 1
6.          exchange A[i] with A[j]
7.  exchange A[i + 1] with A[r]
8.  return i + 1
```

Loop Invariant
At the start of each iteration of the **for** loop of lines 3–6, for any array index k ,

- if $p \leq k \leq i$, then $A[k] \leq x$.
- if $i + 1 \leq k \leq j - 1$, then $A[k] > x$.
- if $k = r$, then $A[k] = x$.

6

Running Time of Partition

Input: A subarray $A[p : r]$ of $r - p + 1$ numbers, where $p \leq r$.
Output: Elements of $A[p : r]$ are rearranged such that for some $q \in [p, r]$ everything in $A[p : q - 1]$ is $\leq A[q]$ and everything in $A[q + 1 : r]$ is $\geq A[q]$. Index q is returned.

```
PARTITION ( A, p, r )
1.  x = A[r]
2.  i = p - 1
3.  for j = p to r - 1
4.      if A[j] ≤ x
5.          i = i + 1
6.          exchange A[i] with A[j]
7.  exchange A[i + 1] with A[r]
8.  return i + 1
```

Let $n = r - p + 1$.
The loop of lines 3–6 takes $\Theta(r - 1 - p + 1) = \Theta(n)$ time.
Lines 1, 2, 7 and 8 take $\Theta(1)$ time each.
Hence, the overall running time is $\Theta(n)$.

7

Worst-case Running Time of Quicksort

```
QUICKSORT ( A, p, r )
1.  if p < r then
2.      // partition A[p..r] into A[p..q - 1]
        and A[q + 1..r] such that everything
        in A[p..q - 1] is ≤ A[q] and everything
        in A[q + 1..r] is ≥ A[q]
3.      q = PARTITION ( A, p, r )
4.      // recursively sort the left part
5.      QUICKSORT ( A, p, q - 1 )
6.      // recursively sort the right part
7.      QUICKSORT ( A, q + 1, r )
```

Assuming $n = r - p + 1$, the worst-case running time of quicksort:

$$T(n) = \begin{cases} \Theta(1) & \text{if } n = 1, \\ \max_{p \leq q \leq r} \{T(q - p) + T(r - q)\} + \Theta(n) & \text{if } n > 1. \end{cases}$$

Replacing q with $k + p - 1$, we get:

$$T(n) = \begin{cases} \Theta(1) & \text{if } n = 1, \\ \max_{1 \leq k \leq n} \{T(k - 1) + T(n - k)\} + \Theta(n) & \text{if } n > 1. \end{cases}$$

8

(Prerequisites Review 3) Deterministic Quicksort and Average Case Analysis

Worst-case Running Time of Quicksort (Upper Bound)

For $n > 1$ and a constant $c > 0$,

$$T(n) = \max_{1 \leq k \leq n} \{T(k-1) + T(n-k)\} + cn$$

Our guess for upper bound: $T(n) \leq c_1 n^2$ for constant $c_1 > 0$.
Using this bound on the right side of the recurrence equation, we get.

$$\begin{aligned} T(n) &\leq \max_{1 \leq k \leq n} \{c_1(k-1)^2 + c_1(n-k)^2\} + cn \\ \Rightarrow T(n) &\leq c_1 \max_{1 \leq k \leq n} \{(k-1)^2 + (n-k)^2\} + cn \end{aligned}$$

But $(k-1)^2 + (n-k)^2$ reaches its maximum value for $k = 1$ and $k = n$.
Hence,

$$\begin{aligned} T(n) &\leq c_1((1-1)^2 + (n-1)^2) + cn \\ \Rightarrow T(n) &\leq c_1(n-1)^2 + cn \\ \Rightarrow T(n) &\leq c_1 n^2 - (c_1(2n-1) - cn) \end{aligned}$$

9

Worst-case Running Time of Quicksort (Upper Bound)

But for $c_1 \geq c$, we have,

$$\begin{aligned} c_1(2n-1) &\geq c(2n-1) \\ \Rightarrow c_1(2n-1) &\geq 2cn - c \\ \Rightarrow c_1(2n-1) - cn &\geq cn - c \end{aligned}$$

But $n \geq 1 \Rightarrow cn \geq c \Rightarrow cn - c \geq 0$, and thus

$$\begin{aligned} c_1(2n-1) - cn &\geq 0 \\ \Rightarrow -(c_1(2n-1) - cn) &\leq 0 \\ \Rightarrow c_1 n^2 - (c_1(2n-1) - cn) &\leq c_1 n^2 \end{aligned}$$

But $T(n) \leq c_1 n^2 - (c_1(2n-1) - cn)$.

Hence, $T(n) \leq c_1 n^2$ for $c_1 \geq c$.

10

Worst-case Running Time of Quicksort (Lower Bound)

For $n > 1$ and a constant $c > 0$,

$$T(n) = \max_{1 \leq k \leq n} \{T(k-1) + T(n-k)\} + cn$$

Our guess for lower bound: $T(n) \geq c_2 n^2$ for constant $c_2 > 0$.
Using this bound on the right side of the recurrence equation, we get.

$$\begin{aligned} T(n) &\geq \max_{1 \leq k \leq n} \{c_2(k-1)^2 + c_2(n-k)^2\} + cn \\ \Rightarrow T(n) &\geq c_2 \max_{1 \leq k \leq n} \{(k-1)^2 + (n-k)^2\} + cn \end{aligned}$$

But $(k-1)^2 + (n-k)^2$ reaches its maximum value for $k = 1$ and $k = n$.
Hence,

$$\begin{aligned} T(n) &\geq c_2((1-1)^2 + (n-1)^2) + cn \\ \Rightarrow T(n) &\geq c_2(n-1)^2 + cn \\ \Rightarrow T(n) &\geq c_2 n^2 + (cn - c_2(2n-1)) \end{aligned}$$

11

Worst-case Running Time of Quicksort (Lower Bound)

But for $c_2 \leq \frac{c}{2}$, we have,

$$\begin{aligned} c_2(2n-1) &\leq \frac{c}{2}(2n-1) \\ \Rightarrow c_2(2n-1) &\leq cn - \frac{c}{2} \\ \Rightarrow cn - c_2(2n-1) &\geq \frac{c}{2} \end{aligned}$$

But $c > 0$, and thus

$$\begin{aligned} cn - c_2(2n-1) &> 0 \\ \Rightarrow c_2 n^2 + (cn - c_2(2n-1)) &> c_2 n^2 \end{aligned}$$

But $T(n) \geq c_2 n^2 + (cn - c_2(2n-1))$.

Hence, $T(n) \geq c_2 n^2$ for $c_2 \leq \frac{c}{2}$.

12

Worst-case Running Time of Quicksort (Tight Bound)

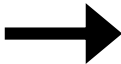

We have proved that

$$T(n) \leq c_1 n^2 \text{ for } c_1 \geq c,$$
$$\text{and } T(n) \geq c_2 n^2 \text{ for } c_2 \leq \frac{c}{2}.$$

Thus $c_2 n^2 \leq T(n) \leq c_1 n^2$ for constants $c_1 \geq c$ and $c_2 \leq \frac{c}{2}$.

Hence, $T(n) = \Theta(n^2)$.

13

Average Case Running Time of Quicksort

```
QUICKSORT ( A, p, r )
1.  if p < r then
2.    // partition A[p..r] into A[p..q-1]
    and A[q+1..r] such that everything
    in A[p..q-1] is ≤ A[q] and everything
    in A[q+1..r] is ≥ A[q]
3.    q = PARTITION ( A, p, r )
4.    // recursively sort the left part
5.    QUICKSORT ( A, p, q-1 )
6.    // recursively sort the right part
7.    QUICKSORT ( A, q+1, r )
```

$$T(n) = \begin{cases} \Theta(1) & \text{if } n = 1, \\ \frac{1}{n} \sum_{1 \leq k \leq n} \{T(k-1) + T(n-k)\} + \Theta(n) & \text{if } n > 1. \end{cases}$$

14

Average Case Running Time of Quicksort

For $n > 1$ and a constant $c > 0$,

$$T(n) = \frac{1}{n} \sum_{1 \leq k \leq n} \{T(k-1) + T(n-k)\} + cn$$
$$\Rightarrow nT(n) = \sum_{1 \leq k \leq n} \{T(k-1) + T(n-k)\} + cn^2$$
$$\Rightarrow nT(n) = 2 \sum_{0 \leq k \leq n-1} T(k) + cn^2 \quad \dots (1)$$

Replacing n with $n-1$,

$$\Rightarrow (n-1)T(n-1) = 2 \sum_{0 \leq k \leq n-2} T(k) + c(n-1)^2 \quad \dots (2)$$

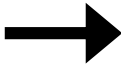

Subtracting equation (2) from equation (1), we get

$$nT(n) - (n-1)T(n-1) = 2T(n-1) + c(2n-1)$$
$$\Rightarrow nT(n) - (n+1)T(n-1) = c(2n-1)$$

Dividing both sides by $n(n+1)$, we get

$$\frac{T(n)}{n+1} - \frac{T(n-1)}{n} = \frac{c(2n-1)}{n(n+1)}$$

15

Average Case Running Time of Quicksort

Assuming $\frac{T(n)}{n+1} = A(n)$, we get from the equation from the previous slide,

$$A(n) - A(n-1) = \frac{c(2n-1)}{n(n+1)}$$
$$\Rightarrow A(n) = A(n-1) + \frac{c(2n-1)}{n(n+1)}$$
$$\Rightarrow A(n) = A(n-1) + \frac{2c}{n+1} - \frac{c}{n(n+1)}$$
$$\Rightarrow A(n) < A(n-1) + \frac{2c}{n+1}$$
$$\Rightarrow A(n) < A(n-2) + \frac{2c}{n} + \frac{2c}{n+1}$$
$$\Rightarrow A(n) < A(n-3) + \frac{2c}{n-1} + \frac{2c}{n} + \frac{2c}{n+1}$$
$$\Rightarrow A(n) < A(n-k) + \frac{2c}{n-k+2} + \frac{2c}{n-k+3} + \dots + \frac{2c}{n} + \frac{2c}{n+1}$$
$$\Rightarrow A(n) < A(1) + \frac{2c}{3} + \frac{2c}{4} + \dots + \frac{2c}{n} + \frac{2c}{n+1}$$

16

Average Case Running Time of Quicksort

Since $A(1) = \frac{T(1)}{2} = \Theta(1)$, we get,

$$\Rightarrow A(n) < \Theta(1) + 2c \left(\frac{1}{3} + \frac{1}{4} + \dots + \frac{1}{n} + \frac{1}{n+1} \right)$$

$$\Rightarrow A(n) < \Theta(1) + 2c \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} + \frac{1}{n+1} \right) - 2c \left(1 + \frac{1}{2} \right)$$

But $H_{n+1} = 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} + \frac{1}{n+1}$ is the $n + 1$ 'st *Harmonic Number*,
and $\lim_{n \rightarrow \infty} H_{n+1} = \ln(n + 1) + \gamma$, where $\gamma \approx 0.5772$ is known as the
Euler-Mascheroni constant.

Hence, for $n \rightarrow \infty$: $A(n) < 2c(\ln(n + 1) + \gamma) - 3c + \Theta(1)$

$$\Rightarrow A(n) < 2c \ln(n + 1) + \Theta(1)$$

$$\Rightarrow \frac{T(n)}{n+1} < 2c \ln(n + 1) + \Theta(1)$$

$$\Rightarrow T(n) < 2c (n + 1) \ln(n + 1) + \Theta(n)$$

$$\Rightarrow T(n) = O(n \log n)$$
