1

A Useful Recurrence

Consider the following recurrence:

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise;} \end{cases}$$

where,  $a \geq 1$  and  $b > 1$ .

Arises frequently in the analyses of *divide-and-conquer* algorithms.

Consider the following recurrences from previous lectures.

**Karatsuba's Algorithm:**  $T(n) = 3T\left(\frac{n}{2}\right) + \Theta(n)$

**Strassen's Algorithm:**  $T(n) = 7T\left(\frac{n}{2}\right) + \Theta(n^2)$

**Fast Fourier Transform:**  $T(n) = 2T\left(\frac{n}{2}\right) + \Theta(n)$

2

How the Recurrence Unfolds

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

3

How the Recurrence Unfolds

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

$$\begin{array}{c} T(n) \\ \downarrow \\ f(n) + aT\left(\frac{n}{b}\right) \end{array}$$

4

How the Recurrence Unfolds

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

5

How the Recurrence Unfolds

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

6

How the Recurrence Unfolds

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

7

How the Recurrence Unfolds

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

8

How the Recurrence Unfolds

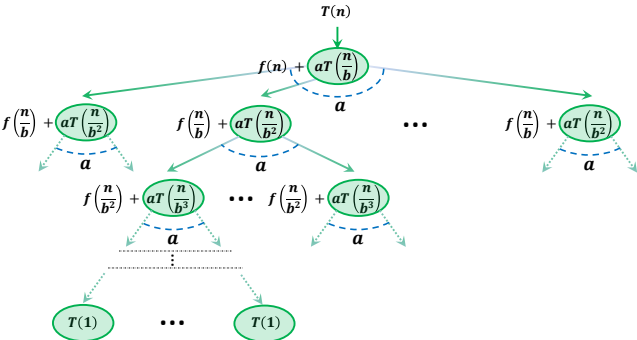

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

9

How the Recurrence Unfolds

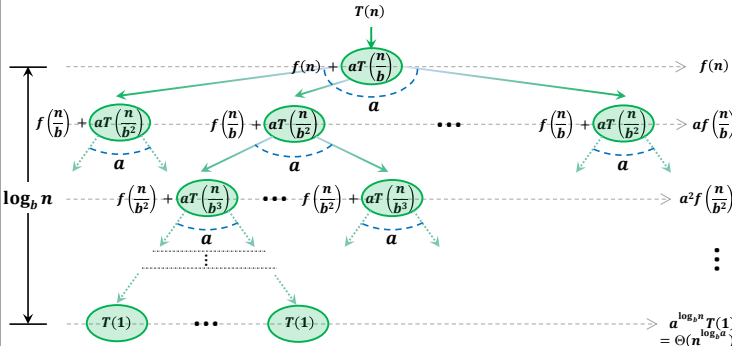

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

10

How the Recurrence Unfolds

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

11

How the Recurrence Unfolds: Case 1

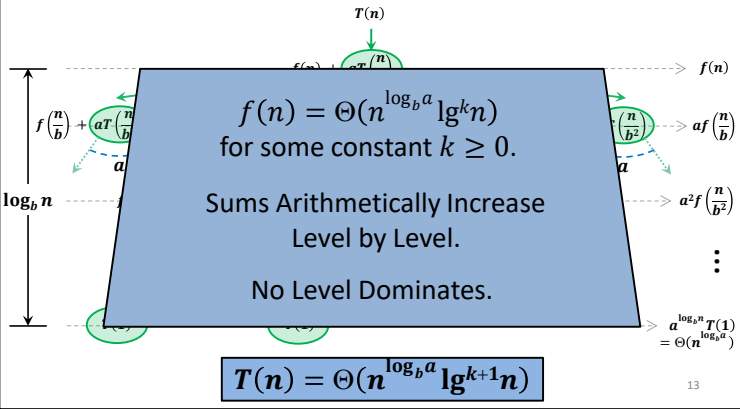

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

12

How the Recurrence Unfolds: Case 2

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

How the Recurrence Unfolds: Case 3

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise.} \end{cases}$$

The Master Theorem

$$T(n) = \begin{cases} \Theta(1), & \text{if } n \leq 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{otherwise } (a \geq 1, b > 1). \end{cases}$$

Case 1:  $f(n) = O(n^{\log_b a - \epsilon})$  for some constant  $\epsilon > 0$

$$T(n) = \Theta(n^{\log_b a})$$

Case 2:  $f(n) = \Theta(n^{\log_b a} \lg^k n)$  for some constant  $k \geq 0$ .

$$T(n) = \Theta(n^{\log_b a} \lg^{k+1} n)$$

Case 3:  $f(n) = \Omega(n^{\log_b a + \epsilon})$  and  $af\left(\frac{n}{b}\right) \le cf(n)$   
for constants  $\epsilon > 0$  and  $c < 1$ .

$$T(n) = \Theta(f(n))$$

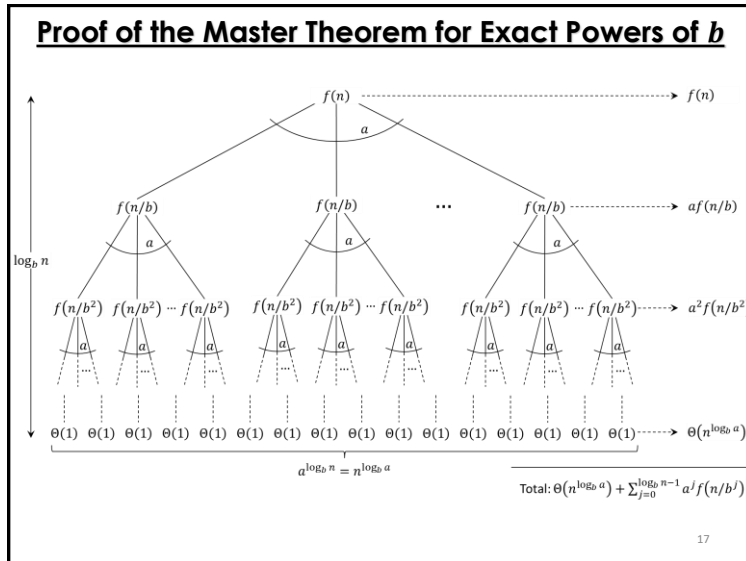

Proof of the Master Theorem for Exact Powers of  $b$

LEMMA 1: Let  $a \geq 1$  and  $b > 1$  be constants, and let  $f(n)$  be a nonnegative function defined on exact powers of  $b$ . Define  $T(n)$  on exact powers of  $b$  by the recurrence

$$T(n) = \begin{cases} \Theta(1), & \text{if } n = 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{if } n = b^i, \end{cases}$$

where  $i$  is a positive integer. Then

$$T(n) = \Theta(n^{\log_b a}) + \sum_{j=0}^{\log_b n - 1} a^j f\left(\frac{n}{b^j}\right).$$

**Proof of the Master Theorem for Exact Powers of  $b$**

**LEMMA 2:** Let  $a \geq 1$  and  $b > 1$  be constants, and let  $f(n)$  be a nonnegative function defined on exact powers of  $b$ . A function  $g(n)$  defined over exact powers of  $b$  by

$$g(n) = \sum_{j=0}^{\log_b n - 1} a^j f\left(\frac{n}{b^j}\right)$$

has the following asymptotic bounds for exact powers of  $b$ :

1. If  $f(n) = O(n^{\log_b a - \epsilon})$  for some constant  $\epsilon > 0$ , then  $g(n) = O(n^{\log_b a})$ .
2. If  $f(n) = \Theta(n^{\log_b a})$ , then  $g(n) = \Theta(n^{\log_b a} \log n)$ .
3. If  $af(n/b) \leq cf(n)$  for some constant  $c < 1$  and all sufficiently large  $n$ , then  $g(n) = \Theta(f(n))$ .

18

**Proof of the Master Theorem for Exact Powers of  $b$**

**PROOF OF LEMMA 2:**

**Case 1:** We have:

$$f(n) = O(n^{\log_b a - \epsilon}) \Rightarrow f(n/b^j) = O\left(\left(\frac{n}{b^j}\right)^{\log_b a - \epsilon}\right).$$

Substituting:  $g(n) = O\left(\sum_{j=0}^{\log_b n - 1} a^j \left(\frac{n}{b^j}\right)^{\log_b a - \epsilon}\right)$ .

Now,  $\sum_{j=0}^{\log_b n - 1} a^j \left(\frac{n}{b^j}\right)^{\log_b a - \epsilon} = n^{\log_b a - \epsilon} \sum_{j=0}^{\log_b n - 1} \left(\frac{ab^\epsilon}{b^{\log_b a}}\right)^j$

$$= n^{\log_b a - \epsilon} \sum_{j=0}^{\log_b n - 1} (b^\epsilon)^j$$

$$= n^{\log_b a - \epsilon} \left(\frac{b^{\epsilon \log_b n} - 1}{b^\epsilon - 1}\right)$$

$$= n^{\log_b a - \epsilon} \left(\frac{n^\epsilon - 1}{b^\epsilon - 1}\right)$$

$$= n^{\log_b a - \epsilon} O(n^\epsilon) = O(n^{\log_b a})$$

Hence,  $g(n) = O(n^{\log_b a})$ .

**Proof of the Master Theorem for Exact Powers of  $b$**

**PROOF OF LEMMA 2:**

**Case 2:** We have:

$$f(n) = \Theta(n^{\log_b a}) \Rightarrow f(n/b^j) = \Theta\left(\left(\frac{n}{b^j}\right)^{\log_b a}\right).$$

Substituting:  $g(n) = \Theta\left(\sum_{j=0}^{\log_b n - 1} a^j \left(\frac{n}{b^j}\right)^{\log_b a}\right)$ .

Now,  $\sum_{j=0}^{\log_b n - 1} a^j \left(\frac{n}{b^j}\right)^{\log_b a} = n^{\log_b a} \sum_{j=0}^{\log_b n - 1} \left(\frac{a}{b^{\log_b a}}\right)^j$

$$= n^{\log_b a} \sum_{j=0}^{\log_b n - 1} 1$$

$$= n^{\log_b a} \log_b n$$

Hence,  $g(n) = \Theta(n^{\log_b a} \log_b n) = \Theta(n^{\log_b a} \log n)$ .

20

**Proof of the Master Theorem for Exact Powers of  $b$**

**PROOF OF LEMMA 2:**

**Case 3:** Since  $f(n)$  appears in the definition of  $g(n)$  and all terms of  $g(n)$  are nonnegative, we conclude that for exact powers of  $b$ :

$$g(n) = \Omega(f(n)).$$

Given that for some constant  $c < 1$  and all sufficiently large  $n$ :

$$\begin{aligned} af\left(\frac{n}{b}\right) &\leq cf(n) \\ \Rightarrow f\left(\frac{n}{b}\right) &\leq \left(\frac{c}{a}\right)f(n) \\ \Rightarrow f\left(\frac{n}{b^j}\right) &\leq \left(\frac{c}{a}\right)^j f(n) \\ \Rightarrow a^j f\left(\frac{n}{b^j}\right) &\leq c^j f(n), \end{aligned}$$

where we assume that the values we iterate on are sufficiently large. Since the last, and smallest such value is  $\frac{n}{b^{j-1}}$ , it is enough to assume that  $\frac{n}{b^{j-1}}$  is sufficiently large.

21

**Proof of the Master Theorem for Exact Powers of  $b$**

**PROOF OF LEMMA 2:**

**Case 3 (continued):** Substituting into the expression for  $g(n)$ , and adding an  $O(1)$  term to capture the terms that are not covered by our assumption that  $n$  is sufficiently large, we get:

$$\begin{aligned} g(n) &= \sum_{j=0}^{\log_b n - 1} a^j f\left(\frac{n}{b^j}\right) \\ &\leq \sum_{j=0}^{\log_b n - 1} c^j f(n) + O(1) \\ &\leq f(n) \sum_{j=0}^{\infty} c^j + O(1) \\ &= f(n) \left(\frac{1}{1-c}\right) + O(1) \\ &= O(f(n)) \end{aligned}$$

Hence, for exact powers of  $b$ :  $g(n) = \Theta(f(n))$ .

22

**Proof of the Master Theorem for Exact Powers of  $b$**

**LEMMA 3:** Let  $a \geq 1$  and  $b > 1$  be constants, and let  $f(n)$  be a nonnegative function defined on exact powers of  $b$ . Define  $T(n)$  on exact powers of  $b$  by the recurrence

$$T(n) = \begin{cases} \Theta(1), & \text{if } n = 1, \\ aT\left(\frac{n}{b}\right) + f(n), & \text{if } n = b^i, \end{cases}$$

where  $i > 0$  is an integer. Then  $T(n)$  has the asymptotic folllbounds below for exact powers of  $b$ , and some constants  $\epsilon > 0$  and  $c < 0$ :

1. If  $f(n) = O(n^{\log_b a - \epsilon})$ , then  $T(n) = \Theta(n^{\log_b a})$ .
2. If  $f(n) = \Theta(n^{\log_b a})$ , then  $T(n) = \Theta(n^{\log_b a} \log n)$ .
3. If  $f(n) = \Omega(n^{\log_b a + \epsilon})$ , and if  $af(n/b) \leq cf(n)$  for all sufficiently large  $n$ , then  $T(n) = \Theta(f(n))$ .

**PROOF OF LEMMA 3:** Follows from Lemma 1 and Lemma 2.

23

**Extending the Master Theorem to All Integral  $n$**

We need to extend our analysis to allow situations in which floors and ceilings appear in the Master recurrence:

$$\begin{aligned} T(n) &= aT\left(\left\lceil \frac{n}{b} \right\rceil\right) + f(n) \quad \dots\dots (1) \\ \text{and } T(n) &= aT\left(\left\lfloor \frac{n}{b} \right\rfloor\right) + f(n) \quad \dots\dots (2) \end{aligned}$$

Obtaining a lower bound on recurrence (1) and an upper bound on recurrence (2) are not difficult because we can use  $\left\lceil \frac{n}{b} \right\rceil \geq \frac{n}{b}$  in the first case and  $\left\lfloor \frac{n}{b} \right\rfloor \leq \frac{n}{b}$  in the second case.

Upper bounding recurrence (1) and lower bounding recurrence (2) require more effort, but they use similar techniques.

So, we will only try to prove an upper bound on recurrence (1).

24

**Upper Bounding  $T(n) = aT[n/b] + f(n)$**

25

**Upper Bounding  $T(n) = aT[n/b] + f(n)$**

26

**Upper Bounding  $T(n) = aT[n/b] + f(n)$**

Let's first determine a depth  $h$  such that  $n_h$  is a constant.

Using the inequality  $\lceil x \rceil \leq x + 1$ , we obtain:

$$\begin{aligned} n_0 &\leq n, \\ n_1 &\leq \frac{n}{b} + 1, \\ n_2 &\leq \frac{n}{b^2} + \frac{1}{b} + 1, \\ n_3 &\leq \frac{n}{b^3} + \frac{1}{b^2} + \frac{1}{b} + 1, \end{aligned}$$

and so on.

In general,

$$\begin{aligned} n_j &\leq \frac{n}{b^j} + \sum_{i=0}^{j-1} \frac{1}{b^i} \\ &< \frac{n}{b^j} + \sum_{i=0}^{\infty} \frac{1}{b^i} \\ &= \frac{n}{b^j} + \frac{b}{b-1}. \end{aligned}$$

27

**Upper Bounding  $T(n) = aT[n/b] + f(n)$**

Letting  $h = \lfloor \log_b n \rfloor$  we obtain:

$$\begin{aligned} n_{\lfloor \log_b n \rfloor} &< \frac{n}{b^{\lfloor \log_b n \rfloor}} + \frac{b}{b-1} \\ &< \frac{n}{b^{\log_b n - 1}} + \frac{b}{b-1} \\ &< \frac{n}{n/b} + \frac{b}{b-1} \\ &= b + \frac{b}{b-1} \\ &= O(1) \end{aligned}$$

Hence, at depth  $h = \lfloor \log_b n \rfloor$  the problem size is at most a constant.

28

### Upper Bounding $T(n) = aT[n/b] + f(n)$

$$T(n) = \Theta(n^{\log_b a}) + \sum_{j=0}^{\log_b n - 1} a^j f(n_j)$$

29

### Upper Bounding $T(n) = aT[n/b] + f(n)$

We have:

$$T(n) = \Theta(n^{\log_b a}) + \sum_{j=0}^{\log_b n - 1} a^j f(n_j)$$

We will have to evaluate the following sum:

$$g(n) = \sum_{j=0}^{\log_b n - 1} a^j f(n_j)$$

30

### Upper Bounding $T(n) = aT[n/b] + f(n)$

We will evaluate the following sum:

$$g(n) = \sum_{j=0}^{\log_b n - 1} a^j f(n_j)$$

**Case 2:** We have:  $f(n) = \Theta(n^{\log_b a})$ .

If we can show that  $f(n_j) = O\left(\left(\frac{n}{b^j}\right)^{\log_b a}\right)$ , then case 2 of

Lemma 2 will go through.

Observe that  $j \leq \log_b n \Rightarrow \frac{b^j}{n} \leq 1$ .

Also,  $f(n) = O(n^{\log_b a})$  implies that there exists a constant  $c' > 0$  such that for all sufficiently large  $n_j$  the following holds:

$$f(n_j) \leq c' \left(\frac{n}{b^j} + \frac{b}{b-1}\right)^{\log_b a}.$$

31

### Upper Bounding $T(n) = aT[n/b] + f(n)$

**Case 2 (continued):** We have:

$$\begin{aligned} f(n_j) &\leq c' \left(\frac{n}{b^j} + \frac{b}{b-1}\right)^{\log_b a} \\ &= c' \left(\frac{n}{b^j} \left(1 + \frac{b^j}{n} \frac{b}{b-1}\right)\right)^{\log_b a} \\ &= c' \left(\frac{n^{\log_b a}}{a^j}\right) \left(1 + \frac{b^j}{n} \frac{b}{b-1}\right)^{\log_b a} \\ &\leq c' \left(\frac{n^{\log_b a}}{a^j}\right) \left(1 + \frac{b}{b-1}\right)^{\log_b a} \\ &= O\left(\frac{n^{\log_b a}}{a^j}\right) \\ &= O\left(\left(\frac{n}{b^j}\right)^{\log_b a}\right) \end{aligned}$$

32

**Upper Bounding  $T(n) = aT[n/b] + f(n)$**

**Case 1:** The proof is similar to that of case 2. The key is to prove the bound  $f(n_j) = O\left(\left(\frac{n}{b^j}\right)^{\log_b a - \epsilon}\right)$  which is similar to what we did in case 2 though the algebra is more intricate.

33

**Upper Bounding  $T(n) = aT[n/b] + f(n)$**

**Case 3:** If  $af\left(\left\lceil\frac{n}{b}\right\rceil\right) \leq cf(n)$  for  $n > b + \frac{b}{b-1}$ , where  $c < 1$  is a constant then it follows that  $a^j f(n_j) \leq c^j f(n)$ .  
Therefore, we can evaluate  $g(n)$  as in the proof of Lemma 2.

34

**Example Applications of Master Theorem**

**Example 1:**  $T(n) = 3T\left(\frac{n}{2}\right) + \Theta(n)$

Master Theorem Case 1:  $T(n) = \Theta(n^{\log_2 3})$

**Example 2:**  $T(n) = 7T\left(\frac{n}{2}\right) + \Theta(n^2)$

Master Theorem Case 1:  $T(n) = \Theta(n^{\log_2 7})$

**Example 3:**  $T(n) = 2T\left(\frac{n}{2}\right) + \Theta(n)$

Master Theorem Case 2:  $T(n) = \Theta(n \log n)$

Assuming that we have an infinite number of processors, and each recursive call in example 2 above can be executed in parallel:

**Example 4:**  $T(n) = T\left(\frac{n}{2}\right) + \Theta(n^2)$

Master Theorem Case 3:  $T(n) = \Theta(n^2)$

35

**Recurrences not Solvable using the Master Theorem**

**Example 1:**  $T(n) = \sqrt{n} T\left(\frac{n}{2}\right) + n$

$a = \sqrt{n}$  is not a constant

**Example 2:**  $T(n) = 2T\left(\frac{n}{\log n}\right) + n^2$

$b = \log n$  is not a constant

**Example 3:**  $T(n) = \frac{1}{2} T\left(\frac{n}{2}\right) + n^2$

$a = \frac{1}{2}$  is not  $\geq 1$

**Example 4:**  $T(n) = 2T\left(\frac{4n}{3}\right) + n$

$b = \frac{3}{4}$  is not  $> 1$ .

36

**Recurrences not Solvable using the Master Theorem**

**Example 5:**  $T(n) = 3T\left(\frac{n}{2}\right) - n$

$f(n) = -n$  is not positive

**Example 6:**  $T(n) = 2T\left(\frac{n}{2}\right) + n^2 \sin n$

violates regularity condition of case 3

**Example 7:**  $T(n) = 2T\left(\frac{n}{2}\right) + \frac{n}{\log n}$

$f(n) = O(n^{\log_b a})$ , but  $\neq O(n^{\log_b a - \epsilon})$  for any constant  $\epsilon > 0$

**Example 8:**  $T(n) = T\left(\frac{n}{2}\right) + 2T\left(\frac{n}{4}\right) + n$

$a$  and  $b$  are not fixed
